› CODEX RESET TRACKER
Will Codex reset today?
Last verified reset + live 24h / 48h forecast
Verified history · Tibo signals · OpenAI status

About

Codex Reset is a Codex reset predictor that checks whether a new reset signal may appear today. It combines a live outlook, verified reset history, and 24h/48h forecast numbers, then lets you compare that against your own /status window in the browser.

What is Codex Reset

Codex Reset is a browser-based tracking page for people asking whether Codex reset today. The homepage is built around one main question: when might the next reset signal show up, based on recent verified resets and current model output.

- a live forecast for the next 24 and 48 hours
- a verified timeline of past reset events
- a personal usage and window tracker that stays in the browser

The site describes its approach as a reset tracker and forecast tool rather than a black-box score. It also says the personal burn meter is account-specific and private, while the global outlook is based on tracked signals and historical cadence.

Key features

Codex Reset focuses on a small set of practical tools for tracking Codex reset timing:

- **Live reset prediction** with current 24h and 48h probabilities shown on the homepage.
- **Verified reset timeline** with past global reset entries, dates, and elapsed time since the last reset.
- **Usage-based personal tracking** where you can copy the exact time from `/status` and compare your usage percentage to pace.
- **Forecast rhythm data** that surfaces median gaps, recent cadence, and the most common reset window.
- **Alert options** including Telegram alerts, a page alarm, and a 15-minute warning.
- **Calendar export** for people who want reset timing outside the browser.
- **Banked reset support** with a guide and expiry tracking for goodwill-style resets.
- **Browser-stored timers** so your personal data does not leave the local session according to the site.

The site also shows the latest model outlook, a confidence label, and historical peak timing, which helps explain the current forecast instead of only showing a yes-or-no answer.

How to use it

Using Codex Reset is straightforward, but it works best if you have access to your Codex client's `/status` output.

1. Open the homepage and check the current answer to the question "Did Codex reset

Read the live 24h and 48h forecast numbers to see the current outlook.

If you want a personal view, enter the exact time from your `/status` output.

Set your usage percentage with the slider so the app can compare your account pace against the tracked rhythm.

If you have a banked reset or expiry, paste the exact future expiry time from your account or offer.

Turn on one of the reminder options, such as Telegram alerts, page alarm, or a 15-minute warning.

Use the calendar export if you want the timing recorded outside the site.

The interface also includes commands such as setting the weekly reset time, copying status, clearing inputs, and opening the banked reset guide. Those controls are aimed at fast checking rather than long-term account management.

Who it is for

Codex Reset is for people who need a quick read on Codex reset timing, especially when reset behavior is irregular.

It may be useful for:

Codex users watching for a goodwill or usage reset

people comparing their current usage to a weekly window

users who want a historical rhythm instead of a vague estimate

anyone who prefers a lightweight tracker over manual note-taking

people who want alerts without building their own reminder system

The site is especially relevant if you already use `/status` and want to keep the exact time, usage level, and reset expectations in one place. It is also useful for people who follow the public reset cadence and want a browser-native forecast without switching tools.

What to know before you use it

Codex Reset is informative, not official. Its predictions are based on observed reset signals, historical timing, and model output, so it can help with planning but cannot

Important caveats:

- The page says the global reset outlook is based on evidence streams, not a combined capability score.
- The personal usage meter stays in your browser, so it is not a shared account dashboard.
- Forecasts can be wrong when reset behavior changes, when live feeds are delayed, or when the current pattern breaks.
- The site notes that waiting longer does not necessarily increase the odds, which means the forecast is not a simple countdown.
- If you need the exact current state of your own Codex account, your official `/status` output is the source to trust.
- If you need authoritative incident or service health information, use OpenAI's official status or support channels instead of the tracker.

The strongest use case for this app is quick orientation: checking whether a Codex reset seems likely soon, reviewing the verified cadence, and setting a reminder. For final account decisions, the official client status and service sources should still come first. Codex Reset is best treated as a live forecast and reset history reference, not as an official control panel.
